

Erwin Lara

banana():

The method banana() returns the product of all of the values in a given array of ints.

a[]: array we are inspecting

kiwi: holds the product of the values the specified array

i: counter we are using to loop through the array

grapefruit():

The method grapefruit() returns the index of the first time a specified integer value is present in a given array and if the given value is not in the array, it returns -1.

a[]: array we are inspecting

grape: the value we are searching for in the array

i: counter we are using to loop through the array

pineapple():

The method pineapple() returns how many times a specified integer value occurs in a given array.

a[]: array we are inspecting

apple: the value we are checking to see how many times it occurs in the given array

pear: the counter for how many times the value apple is present in the given array

pine: temporarily holds value stored in array at a each index as we loop through array
